PERMACRETE 10-33

Low odor, low viscosity epoxy system for concrete crack filling/patching/coating/bonding

GENERAL TYPE:

A two component low viscosity epoxy resin system that contains no aggregate or filler of any type.

USES:

Used as a high strength crack filler, adhesive mortar binder system, or as a coating. When mixed with aggregate it yields a high strength epoxy mortar for patching or resurfacing. This material cures well in the presence of moisture and will form a strong bond to damp concrete as well as other structural materials. This property makes the material of particular interest in many concrete applications such as grouts, patching compounds and adhesives for bonding old concrete to freshly poured concrete or as a crack filler.
