FP-400

P-400

Acrylic polymer enhanced concrete resurfacing and repair compound for repairs greater than 1/2 inch in depth.

DESCRIPTION:

FP-400 is a two component, high strength compound designed for leveling, resurfacing, or patching of concrete surfaces. **FP-400** is indicated where the depth of repair is greater than 1/2 inch. **FP-400** contains non-shrink additives which allows placement to 2 inches in depth without the addition of aggregate. For greater thickness the addition of aggregate is recommended. **FP-400** is supplied in pre-measured units consisting of **FP-400** liquid and **FP-400** powder. When the powder mix is added to the liquid a high strength, highly workable repair compound is formed. **FP-400**'s liquid component ensures enhanced flexural, tensile, structural, and bond strengths. **FP-400** is self curing and waterproof which allows exterior or interior applications. **FP-400** may be used to resurface large areas as well as cracks or depressions.
