Permacrete 61-55

PERMACRETE 61-55

Adhesive concentrate additive for resurfacing and leveling concrete exterior and interior surfaces.

DESCRIPTION:

PERMACRETE 61-55 is a concentrated acrylic latex polymer which when added to cement mixes imparts exceptional bonding and self curing properties.

It provides these patches with increased physical and chemical properties, freeze-thaw resistance and greatly reduces water absorption and water vapor permeability. These characteristics make **PERMACRETE 61-55** an ideal admixture for both interior and exterior use, above or below grade.
