FP-200

FP-200

Acrylic polymer modified underlayment for filling and leveling.

DESCRIPTION:

FP-200 is supplied in a prepackaged unit containing an acrylic latex liquid and smooth consistency powder mix. The primary use of **FP-200** is to level and patch concrete floors or wood seams that will ultimately receive V.A.T., ceramic tile or carpet. **FP-200** can be used for ?skim coating? but also works well in heavier filling applications. **FP-200** can be applied up to one half inch in thickness in one application. This eliminates the need to do several lifts to prevent shrinkage as with conventional underlayments.
